The dashboard in five minutes

Getting started · https://rulemancer.com/blog/docs/dashboard-tour/

The trader dashboard is the working surface: bots on the left of the navigation, evidence of what they did in the middle, money and settings at the end.

The screens that matter

Screen	What it is for
My Bots	Every bot you created, with its status, P&L and last check time
Strategy Marketplace	Ready-made rule templates across DCA, grid, trend, momentum and mean reversion
Backtesting	Replay a rule on historical candles before it runs
Portfolio & Analytics	Allocation, realized and unrealized P&L, best and worst bots
Trade History	Every fill with filters and CSV export
Connected Exchanges	API keys, their permissions and the testnet toggle
Notifications	Which events go to which channel, plus quiet hours
Trading Settings	Beginner or advanced mode and your default risk values
Billing	Plan, usage meters and invoices

The status line to watch

Each bot row shows the last time the engine checked it. A running bot that has not been checked for several minutes usually means the platform cron is behind — the bot is not trading, but it is also not broken. Check the event log on the bot first, then the platform status.

Where to start

If you have never run a bot, open **My Bots → New bot**, pick a template from the marketplace and launch it in paper mode. The next page explains that flow step by step.
