Write a rule in plain English

Bots & rules · https://rulemancer.com/blog/docs/write-a-rule/

A rule is a sentence with a trigger, an action and optional limits. The builder writes that sentence for you while you click, which makes it easy to check before anything runs.

The blocks

Block	What it decides	Example
IF	Trigger condition	price drops 5% in 24 hours
AND / OR	Extra filters	RSI(14) below 30
THEN	Order to place	buy $100 of BTC
REPEAT	How many times it may fire	at most 3 times
STOP	When the bot gives up	after 6 trades or 8% loss

Available conditions

Price change, price cross, price range, RSI, MACD crossover, moving-average cross, volume change, Bollinger Bands, market cap and breakout — plus time-based DCA schedules. All of them are evaluated when a candle closes on your chosen timeframe (15m, 1h, 4h or 1d).

A worked example

IF BTC drops 5% in 24 hours AND RSI(14) is below 30, THEN buy $100 of BTC. Add **REPEAT at most 3** so a long slide cannot turn into ten buys, and a stop-loss at 4% so a failed dip is capped.

Rules that will not fire

Two filters that contradict each other — "RSI below 30" and "price up 10% in the same window" — pass validation and never trigger. If a bot has been running for a week with no fills, check the rule monitor: it shows the current reading of every condition.
